

### **Lecture 21**

Examples

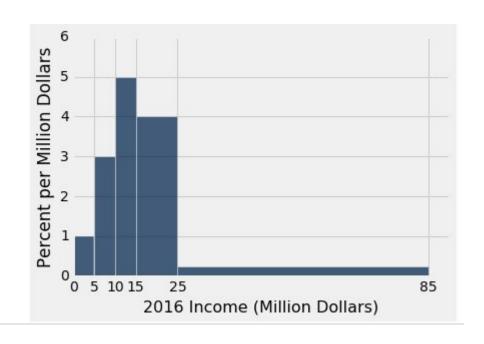

### **Announcements**

# **Histograms**

## **Using the Density Scale**

(a) Which bin has more people: [10, 15) or [15, 25)?

- (b) What percent of incomes are in the [25, 85) bin?
- (c) If you draw one bar over [10, 25), how tall will it be?
- (d) Find (or give bounds for) the median income.

### **Answers**

(a) [15, 25)

(b) 15%

(c) 4.33 percent per million dollars

(d) At least 15 and less than 25

# **Probability**

### **Exercise 1**

I pick one of the 12 months at random. Independently, you pick one of the 12 months at random.

What is the chance that we both pick the same month?

(i) 
$$(1/12) * (1/12)$$
 (ii)  $(1/12) + (1/12)$  (iii)  $1/12$ 

(iii) = 
$$(12/12) * (1/12)$$
 Also (iii) =  $12 * (i)$ 

#### **Exercise 2**

Marbles: G, G, G, G, R, R, R, B, B, Y. Draw 4 at random.

$$P(no G) = ?$$
  $P(all G) = ?$ 

If without replacement: If without replacement: (6/10)\*(5/9)\*(4/8)\*(3/7) (4/10)\*(3/9)\*(2/8)\*(1/7)

### **Exercise 3**

Marbles: G, G, G, G, R, R, R, B, B, Y. Draw 4 times at random with replacement.

1 - (6/10)\*(6/10)\*(6/10)\*(6/10) is the chance of: at least one G

 $(4/10)^{**}4 + (3/10)^{**}4 + (2/10)^{**}4 + (1/10)^{**}4$  is the chance of: all four are the same color

## **Testing Hypotheses**

## **Before You Compute Anything**

- Figure out the viewpoint the question wants to test, and formulate:
  - Null hypothesis: Completely specified chance model under which you can simulate data
  - Alternative hypothesis: Viewpoint comes from the question
  - Test statistic: to help you choose one viewpoint
- Say what kind of values of the statistic will make you lean towards each alternative

## **Categorical Data**

### **Null Hypothesis**

The sample is drawn at random from a specified categorical distribution.

- Swain's jury panel was drawn at random from a population that had 26% black men
- Each pea plant has 75% chance of being purple flowering, regardless of other plants
- The Alameda County jury panels were drawn at random from the specified distribution of eligible jurors

#### Swain v. Alabama

- Null: Swain's jury panel was drawn at random from a population that had 26% black men
- Alternative: There were too few black men on the panel for it to look like a random sample
- Test statistic:

Number of black men in panel

P-value direction: to the left

#### Mendel's Model

- Null: Each pea plant has 75% chance of being purple flowering, regardless of other plants
- Alternative: The model isn't good.
- Test statistic:

```
percent purple in sample - 75
```

*P*-value direction: to the right

Could also have used TVD; direction is still to the right

TVD = (|prop. purple - 0.75| + |prop. white - 0.25|)/2

### **Alameda County Jury Panels**

- Null: The Alameda County jury panels were drawn at random from the specified distribution of eligible jurors
- Alternative: The panels were not drawn at random from the specified distribution.
- Test statistic:

**TVD** 

*P*-value direction: to the right

### **Numerical Data**

#### **GSI's Defense**

- Null: Section 3 scores are are like a sample drawn at random without replacement from the whole class.
- Alternative: The Section 3 average is too low for the section to be a random sample from the class.
- Test statistic:

Section 3 average

P-value direction: to the left

# **Comparing Two Samples**

### **Birthweights**

- Null: In the population, the distributions of the birth weights of the babies in the two groups are the same.
- Alternative: In the population, the babies of the mothers who didn't smoke (B) were heavier, on average, than the babies of the smokers (A).
- Test statistic:

Group B sample average - Group A sample average *P*-value direction: to the right

### **Deflategate**

- Null: Each group is like a sample drawn at random without replacement from all 15 footballs.
- Alternative: The Colts' values are too low for them to look like a random sample from the 15 balls.
- Test statistic:

Colts' average - Patriots' average

P-value direction: to the left

#### **RCT**

- Null: The distribution of all the potential control scores is the same as the distribution of all the potential treatment scores.
- Alternative: The distribution of all the potential control scores is different from the distribution of all the potential treatment scores.
- Test statistic:
  - | control group average treatment group average | P-value direction: to the right
