Linear Regression

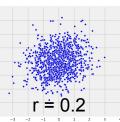

Announcements

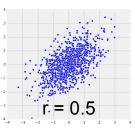

Correlation (Review)

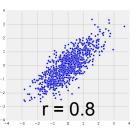

The Correlation Coefficient r

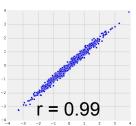

- Measures *linear* association
- Based on standard units
- $-1 \le r \le 1$
 - \circ r = 1: scatter is perfect straight line sloping up
 - r = -1: scatter is perfect straight line sloping down
- r = 0: No linear association; *uncorrelated*

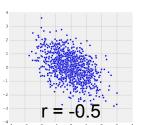

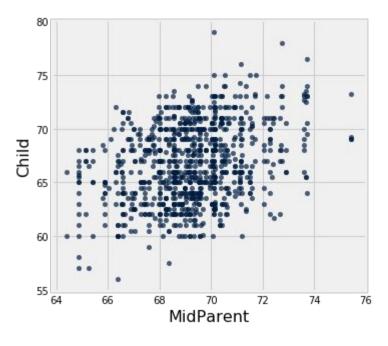

Definition of r

Correlation Coefficient (r) =

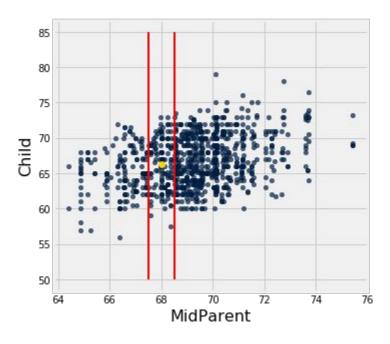

Measures how clustered the scatter is around a straight line

Prediction

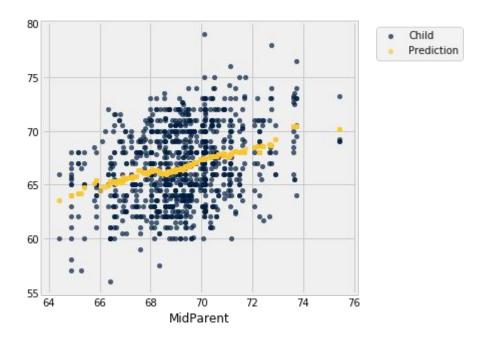

Galton's Heights

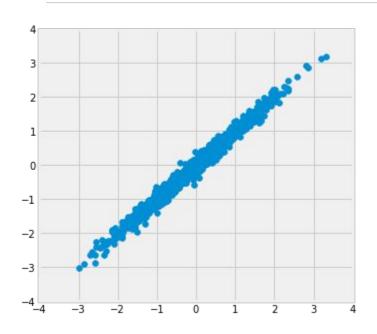

Galton's Heights

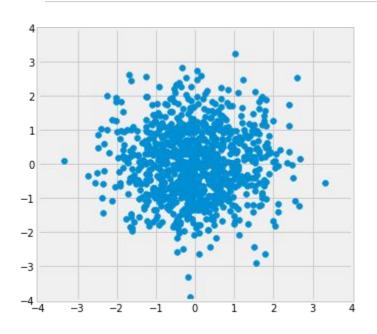

Galton's Heights

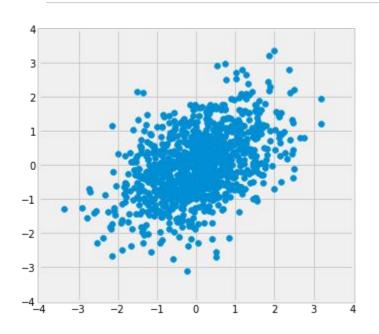

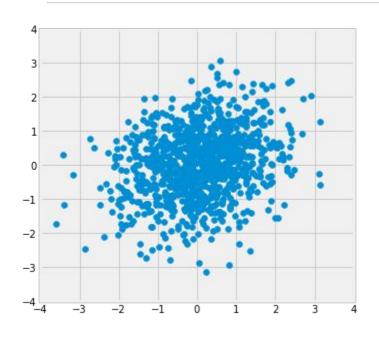

$$r = 0.99$$

$$r = 0.0$$

$$r = 0.5$$

$$r = 0.2$$

Nearest Neighbor Regression

A method for prediction:

- Group each x with a representative x value (rounding)
- Average the corresponding y values for each group

For each representative x value, the corresponding prediction is the average of the y values in the group.

Graph these predictions.

If the association between x and y is linear, then points in the graph of averages tend to fall on the regression line.

Linear Regression

(Demo)

Regression to the Mean

A statement about x and y pairs

- Measured in standard units
- Describing the deviation of x from 0 (the average of x's)
- And the deviation of y from 0 (the average of y's)

On average, y deviates from 0 less than x deviates from 0

Regression Line
$$y_{(su)} = r \times x_{(su)}$$

Not true for all points — a statement about averages

Slope & Intercept

Regression Line Equation

In original units, the regression line has this equation:

$$\left| \frac{\text{estimate of } y - \text{average of } y}{\text{SD of } y} \right| = r \times \left| \frac{\text{the given } x - \text{average of } x}{\text{SD of } x} \right|$$

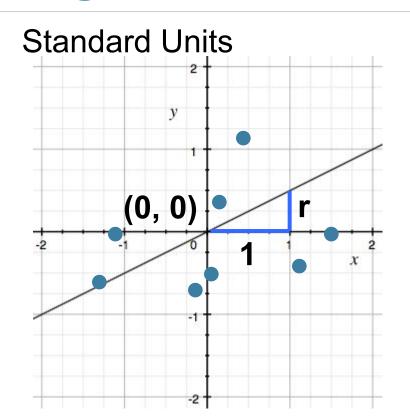

estimated y in standard units

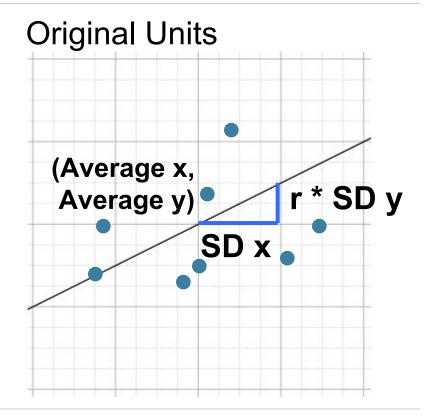

x in standard units

Lines can be expressed by slope & intercept

$$y = \text{slope} \times x + \text{intercept}$$

Regression Line

Slope and Intercept

estimate of y = slope * x + intercept

slope of the regression line =
$$r \cdot \frac{SD \text{ of } y}{SD \text{ of } x}$$

intercept of the regression line = average of $y - slope \cdot average of x$
